

DataAI Training

Training guide for DataAI reporting, charts, maps, analytics, market models, AI-supported analysis, matrix balancing, and DataAILite in-memory workflows.

Landing Page Guide

Landing Page guide: <https://oureports.net/oureports/LandingPage.pdf>

1. Registration

1.1 Quick start

Use the Quick Start page and video for a fast first login and first report path.

1.2 Regular start

Register as a user. You can work with the hosted database or with your own user database.

Using our database on our server: <https://oureports.net/oureports/Videos/RegOurDb.mp4>

Using user database: <https://oureports.net/oureports/Videos/UserRegistrationVideo.mp4>

1.3 Company registration

Use Unit Registration for organization-level setup.

Unit Registration video: <https://oureports.net/oureports/Videos/UnitRegistrationVideo.mp4>

1.4 Exercises

Register yourself as a user and open the list of reports.

2. Data Import

Import data into a report workflow and then analyze it in memory. Imported data can be used by report views, charts, analytics, AI analysis, and export packages depending on the selected page.

Data Import video: <https://oureports.net/oureports/Videos/DataImport.mp4>

3. Reports, Charts, Maps

Create reports, define report data queries, format report output, build SSRS-style report views, create Google Charts and dashboards, and prepare map output.

DataAI documentation: <https://oureports.net/oureports/DataAIHelp.aspx>

General video: https://oureports.net/oureports/Videos/zoom_2.mp4

3.1 List of Reports

Create a new report, edit report definition, define parameters, share reports with users, and open report output.

3.2 List of Tables / Classes

Use table and class lists, including class-to-subclass links, to understand available data.

3.3 List of Joins

DataAI can suggest joins by finding fields in different tables that contain similar data.

3.4 SSRS Reports

Build Matrix, DrillDown, Bar, Pie, and Line reports. Download RDL report definition files when needed.

Advanced Report Designer: <https://oureports.net/oureports/AdvancedReportDesigner.pdf#page=1>

3.5 Google Charts and Dashboards

Use chart types, chart dashboards, chart recommendations, and saved dashboards.

Google Charts and Dashboards: <https://oureports.net/oureports/GoogleChartsAndDashboards.pdf>

3.6 Maps

Use Map Definition, Map Report, and Map Readiness to check coordinates and prepare map-ready data.

Map Definition documentation: <https://oureports.net/oureports/MapDefinitionDocumentation.pdf>

3.7 Exercises

Create a report for your own data or copy one of the Sandbox/Analytics reports, then run data exploration, report view, chart, and map exercises.

4. Analytics

Analytics pages work from the current report data or imported dataset. Analysis is done in memory, grids can link to source records, AI buttons send result grids for explanation, and exports are available where supported.

Analytics documentation: <https://oureports.net/oureports/AnalyticsNew.pdf>

4.1 Core Analytics

Use categories, overall statistics, group statistics, field correlation, and correlation thresholds before deeper analysis.

4.2 More Analytics Pages

Click an analytics title below to open its documentation page.

Analytics title	Training purpose
Analytics Dashboard	Tiles and previews for all analytics available for the current report.
Detail Analytics	Entry page for report statistics and analysis links.
Overall Statistics	Field summaries for counts, totals, averages, min/max, and statistics.
Group Statistics	Group summaries for report groups, totals, averages, and statistics.
Field Correlation	Correlations between numeric fields.
Correlation Threshold	Threshold-filtered correlation views.
Pivot / Cross Tab	Cross-tab reports by row, column, value field, and aggregation.
Variance Analysis	Percentage-change, variance, and contribution-to-total analysis.
Comparison Reports	Compares periods, groups, locations, queries, or imported files.
Data Profiling	Automatic profiling of every field and statistical summaries.
Data Quality	Missing values, duplicates, invalid dates, and inconsistent values.
Ranking Analysis	Top, bottom, and average ranking for selected dimensions.

Analytics title	Training purpose
Regression Analysis	Best-fit equations, prediction, and logistic probability.
Trends	Interactive trend charts from equations and selected X values.
Time Based Summaries	Day/week/month/quarter/year summaries.
Time Series	Moving averages and rolling totals.
Outlier Flagging	Outlier flags by standard deviation, percent difference, or business rules.
Chart Recommendations	Recommended charts, chart links, and dashboard creation.
Audit Summaries	Fields, filters, thresholds, and aggregation options behind results.
Map Readiness	Coordinate readiness checks and KML-ready data review.
Cohort Analysis	Cohort retention and activity by first and later periods.
Funnel Analysis	Ordered stage counts, drop-off, and conversion percentages.
ABC Pareto Analysis	A/B/C contribution classes and cumulative share.
Data Drift Analysis	Distribution shift between two selected segments.
KPI Builder	Calculated business indicators by selected group.
Data Dictionary	Field documentation, examples, detected type, and uses.
Data Readiness Scanner	Recommends analyses and fields by readiness score.

4.3 Analytics Exercises

Open a report, click Analytics Dashboard, use Data Readiness Scanner to identify useful pages, inspect record links, then click AI to receive a natural-language explanation of an analytical grid.

5. Market Models

Market pages are business-model pages where available data supports them: demand, pricing, elasticity, basket relationships, segments, churn, risk, inventory, profitability drivers, and scenario assumptions.

Market documentation: <https://oureports.net/oureports/Market.pdf>

Market Dashboard checks whether useful fields exist and explains missing data when models are not ready. Click a title below to open the related Market documentation page.

Market title	Model / training purpose
Market Dashboard	Tiles and readiness indicators for market model pages.
Market Demand	Demand model using category/date/value fields.
Market Pricing	Pricing sensitivity by price band and optional dimension.
Market Elasticity	Price-demand response and elasticity assumptions.

Market title	Model / training purpose
Market Basket	Market-basket style co-occurrence and weighted basket value when value field exists.
Market Segments	Customer/product/category segmentation using selected fields and values.
Market Churn	Retention/churn scoring where data supports activity or status patterns.
Market Risk	Risk scoring based on selected dimensions, value patterns, and thresholds.
Market Inventory	Inventory movement, period-based demand, estimated current inventory, supply period...
Market Profit	Profitability drivers and stronger cost/profit models when cost fields are available.
Market Scenario	Scenario assumptions for market changes, percent changes, and projected outcomes.

5.1 Market Exercises

Open Market Dashboard for a report, review data readiness, run Market Demand or Market Pricing first, then compare other models such as Basket, Inventory, Profit, Elasticity, or Scenario when matching fields are present.

6. Analyzing Public Data

Public data can be uploaded or imported into a report workflow. Good candidates include datasets with category fields, date fields, numeric measures, geographic fields, and enough records to support summaries, charts, analytics, market analysis, and AI review.

Exercise. Upload public data not exceeding the project limit on your local computer, create a new report, then run Analytics Dashboard and Market Dashboard to see what is possible for that dataset.

7. AI and DataAI

AI and DataAI combine analytical intelligence with AI explanation. Analytical pages prepare focused result grids; AI can then explain patterns, risks, summaries, and next questions based on the grid instead of sending the full source dataset.

AI and DataAI video: <https://oureports.net/oureports/Videos/videoAIandDataAI.mp4>

DataAI video: <https://oureports.net/oureports/Videos/videoDataAI.mp4>

AI and DataAI guide: <https://oureports.net/oureports/AIandDataAI.pdf>

8. Matrix Balancing

Matrix Balancing balances a starting matrix against row and column targets or against another target matrix. It can compare two matrices from different periods, years, scenarios, or assumptions and helps identify which cells materially affect the output.

Matrix Balancing: <https://oureports.net/oureports/MatrixBalancing.pdf>

Matrix Balancing Samples: <https://oureports.net/oureports/MatrixBalancingSamples.pdf>

Matrix Balancing with AI: <https://oureports.net/oureports/MatrixBalancingWithAI.pdf>

Open Trends can help interpret matrix-balancing outputs by turning charted values into equations and predictions, so the user can understand direction, sensitivity, and likely development of the complex data.

Videos for matrix balancing scenarios:

Video: <https://oureports.net/oureports/Videos/MatrixBalance1a1b.mp4>

Video: <https://oureports.net/oureports/Videos/MatrixBalance2a3a.mp4>

Video: <https://oureports.net/oureports/Videos/MatrixBalance2b2c.mp4>

Video: <https://oureports.net/oureports/Videos/MatrixBalance3b3c.mp4>

Video: <https://oureports.net/oureports/Videos/MatrixBalance4a4b4c.mp4>

Exercise. Open Matrix Balancing from the left menu, select row/column/value fields, compare starting and target matrices, then use AI and Trends to interpret important cell changes.

9. DataAILite - in memory

DataAILite is the in-memory web application version. Data can be imported or read from user SQL query results, analytics and reports are performed in memory, results can be exported where supported, and no analytical data is stored after Log Off.

DataAILite documentation: <https://oureports.net/oureports/DataAILite.pdf>
